Full-time work rights from December 2026 (Temporary Graduate 485 visa) | Open to relocating anywhere in Australia

EDUCATION

Bachelor of Computer Science (Artificial Intelligence) | *Adelaide University, International Merit Scholarship* Feb 2024 to Dec 2026

- Top results in Web and Database Computing, Databases and Ethical Data, Interactive Systems Design, and Event Driven Computing.
- Coursework: Algorithm Design and Data Structures, Object-Oriented Programming, Cloud and Concurrent Programming, Cybersecurity Fundamentals, Machine Learning.

EXPERIENCE

Software Engineering Intern | *Viemo Capital & Consulting, Adelaide*

Aug 2026 to Nov 2026

Voice AI meeting assistant prototype, one of 4 engineers selected from 11 shortlisted applicants. TypeScript, React, Node.js, WebSockets, Google Cloud Text-to-Speech, LLM APIs

- Found and fixed a defect that made meeting summaries fail after 4 minutes, by load-testing with scripted multi-speaker meetings and tracing it to unbounded LLM output growth. Every update then succeeded, and action item capture rose from 2 of 5 to 5 of 5.
- Built the real-time voice pipeline end to end, answering a spoken question aloud in a median 1.9 seconds and recovering from dropped connections in a median 2.8 seconds through token-refreshing reconnection.
- Stopped the assistant transcribing and replying to its own voice, with zero self-replies across 20 spoken replies on open speakers, by moving echo suppression from the transcription results to the audio source.
- Designed a 7-entity data model adopted into the company's platform-wide schema, including an append-only consent log, and made capture crash-safe: 54 transcript lines survived a mid-meeting browser crash that previously lost the whole meeting.
- Built an evaluation harness measuring word error rate (1.5 to 2.4%), speaker attribution accuracy (95 to 98%) and action item recall, and caught 5 defects before merge while reviewing teammates' pull requests.

PROJECTS

agrimsharma.com, Portfolio with AI Assistant | *Next.js, TypeScript, Claude API, Vercel*

May 2026 to Jun 2026

- Built the site from scratch in about 3,000 lines of TypeScript, with an assistant that answers only from a curated knowledge base.
- Locked the site down with a Content Security Policy, two-year HSTS with preload and clickjacking protection, and kept the API key server-side by re-streaming the model's events to the browser as plain text.
- Hardened the chat endpoint with a per-IP limit of 8 requests a minute, 500-character input caps and checks that drop forged history.

MetaPlay, Game Discovery Platform | *Vue.js, Node.js, Express, PostgreSQL*

Mar to Jun 2025, live 2026

- Built 15+ REST endpoints and the 9-table schema for a 5-person team, and wired the Vue front end to Express.
- Added email and Google OAuth2 sign-in with separate admin, user and guest permissions.
- Deployed it to production on my own in June 2026 by tracing broken OAuth and deployment config, then moved MySQL to PostgreSQL after a hosting outage. It has stayed live since.

GPS Tracker Dashboard | *Java, Sodiium FRP, Swing*

Mar 2026 to May 2026

- Built a real-time dashboard that merges 10 concurrent GPS streams from Microsoft's Geolife dataset, with a location filter users can change while it runs.
- Tracked each device's distance over a rolling 5-minute window without shared mutable state, covered by 19 automated checks including timing-sensitive eviction.

Pathfinder: Graph Search Algorithms | *Python, BFS, Dijkstra, A**

Mar 2026 to Jun 2026

- Implemented BFS, uniform-cost search (Dijkstra) and A* with two heuristics from scratch, on grids where uphill moves cost more.
- A* expanded 41 nodes to uniform-cost search's 75 and BFS's 112 on the same path; on a 20 by 20 map, BFS's route cost 24% more.

Pacific Village Explorer | *React, Leaflet, Claude API*

Jul 2026

- Placed top 12 of 75 submissions from 110 teams at the USYD Humanitarian Innovation Hackathon, the only Adelaide student to reach the final, by building a climate-adaptation planning tool for Pacific village councils in 44 hours.
- Led the AI engine, grounding prompts in IPCC and SPREP climate data, with an offline fallback that saved the live demo.

TECHNICAL SKILLS

Languages: Java, Python, C++, TypeScript, JavaScript, SQL, HTML, CSS

Web: Node.js, Express, Spring Boot, React, Vue.js, Next.js, REST APIs, WebSockets

Data and cloud: PostgreSQL, MySQL, MongoDB, Docker, Google Cloud (Text-to-Speech API), Microsoft Azure (AZ-900 certified)

Practices: Git and code review, load testing, automated testing, OAuth2, rate limiting, graph algorithms (BFS, Dijkstra, A*)

LEADERSHIP

President, Adelaide University Tennis Club

Jul 2024 to Mar 2026

- Took over a club with no committee and about 10 active members, and grew it tenfold to 100+ in 18 months by recruiting and leading an 8-person committee; named Club of the Year 2025 and won the Jessop Shield.
- Led our side of the merger with UniSA's club during the university amalgamation, taking a joint constitution through revisions until both committees signed, and kept both independent coaching businesses through a three-month joint trial.
- Secured \$7,000+ in new fencing, nets and poles through four grant applications and negotiation with university sport administration.
